

Secrets of the See-Through Factory

On Intervening in Opaque Transparency

Sven Lütticken

Essay – November 18, 2011

Art historian and critic Sven Lütticken sketches how concepts such as transparency and opacity, openness and secrecy are being used by artists in increasingly subtle ways. They are particularly interested in the question of how we can make ourselves ‘visible as something other (either more or less) than the kind of subject to which we tend to be reduced’.

We live in the age of open secrets. More than anything else, WikiLeaks has shown the relative weakness, in today's global empire, of the essential Enlightenment act that is the revealing of hidden secrets. Such revelations may endanger American or European troops in Afghanistan, but in Europe and the USA their effects seem limited, as there is plenty of online outrage, but little in the way of political effects – and WikiLeaks has itself come under attack for its 'lack of transparency'. Perhaps it is one of the 'zones of opacity' that the Invisible Committee deems necessary.¹ According to this logic, a prying police state that wants to turn its subjects into see-through citizens has to be countered with opacity even while the state's own zones of opacity are relentlessly critiqued. After all, is this 'transparent', 'democratic' system not a *de facto* conspiracy in the service of the happy few? But the strategies of radical groups and their corporate antagonists mirror each other: Julian Assange approved of the *News of the World* hacking people's phones, even while bemoaning that these practices did not go far enough.² He did not pause to question the complete perversion of the ideology of transparency in the hands of Rupert Murdoch and his goons.

It is a recurring feature of modernity that attacks on an opaque system that functions as a *de facto* conspiracy themselves take on a conspiratorial character – from the Enlightenment (Masonic lodges) via anarchist cells and Georges Bataille's Acéphale and various groups of the 1970s to, precisely, the Invisible Committee and WikiLeaks.³ Such oppositional forces produce strange blends of opacity and transparency – *opaque transparency* and *transparent opacity* – that mirror the state of affairs they oppose. Thus rather than with a static opposition between hiding and uncovering, we are dealing with a dazzling dialectic. More than ever, it is futile to side with either opacity or transparency as such. Rather than turning openness into a cult or promoting the cult of secrecy for its own sake, the aim should be to examine the collusion between the two poles so as to develop strategies for prying open the cracks in the apparently seamless surface of opaque transparency – to exacerbate the latent contradictions and turn them into overt antinomies.

This is where art comes in. Not only have various artistic and quasi-artistic groups, from symbolism to the Situationist International via surrealism and Bataille, taken on cult-like or conspiratorial forms, but the very fabric of the modern work of art is an object lesson in the dialectic of opacity and transparency. For much of modernity, visual art has perfected techniques for mystifying through openness, laying bare its procedures with obscure results. The work of art being a commodity that is both eccentric and exemplary, art can be seen as a form of political economy that *intervenes in* as much as it reflects on Art

today's opaquely transparent and transparently opaque spectacle.⁴

Structure and System

Theodor W. Adorno analysed the development of modern art in terms of an ever more rational construction.⁵ However, this constructive rationality did not result in works that were transparent and devoid of mystery. On the contrary, it is the apparent rationality of ever more carefully planned construction that cements their status as riddles.⁶ In a disenchanted world dominated by technocratic 'purposive rationality', Adorno averred that art constitutes a scandal because it cannot rid itself of magic, of primeval enchantment. Even the most constructive modern art remains fundamentally mimetic. In its mimicking of rational construction methods it is a kind of 'secularized magic' that reveals itself as make-believe, as *Schein*, as illusive appearance.⁷

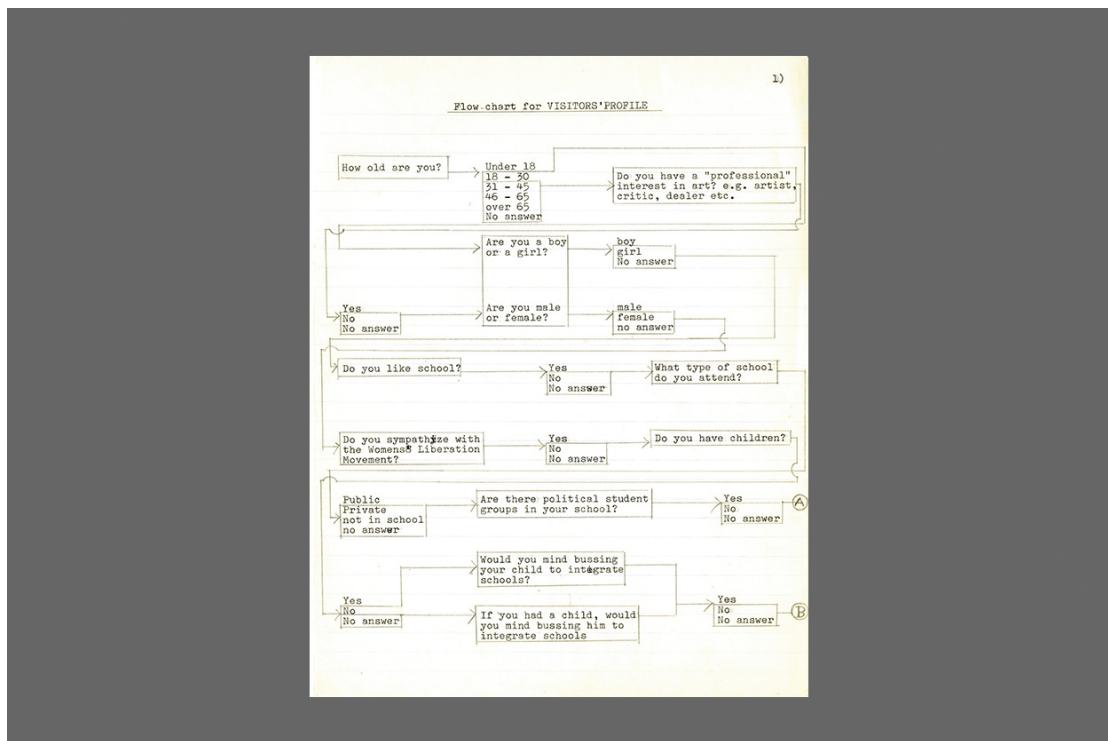

Some modern artists went very far in their mimetic appropriation of technocratic rationality. This is true in particular of some movements in European art around the 1960s, including Zero in Germany and the Dutch Nul group. A fetish in these circles was the notion of structure, praised by Jan Schoonhoven in terms that barely disguise their Platonism: 'Structure gives line and form substance. Structure is reality. Structure determines the effects of light.'⁸ Structural transparency also suggested a social analogy: transparent, non-hierarchical art for a modern and rational society.⁹ This analogy broke down in the late 1960s, with Sol LeWitt's emphasis on the *irrational* nature of grid structures, and with Hans Haacke's investigation of (social) systems.

Haacke had actually operated in the margins of the ZERO movement, collaborating for instance on the aborted 'Zero op zee' event that the Dutch Nul group attempted to organize by the sea in Scheveningen. Haacke created pieces that often used modern materials to investigate natural phenomena – his *Condensation Cubes* were closed Plexiglas cubes that are more or less transparent depending on the room temperature and the resulting amount of condensation inside the cube. For the critic Jack Burnham, Haacke's practice was one important indicator of a changing relationship between art and technology, as well as of a move away from object-based art to *systems art*. According to Burnham, the structures of most 1950s and early 1960s art remained ultimately illusory, belonging to the world of appearances: they were still visual compositions rather than functional constructions.¹⁰ But more fundamentally, the analysis had to move up a level, from structure to system. Systems theory, with its roots in biology, promised to be a new paradigm that would in fact 'diminish the distinction between biological and non-biological systems', and a new systems-oriented art would 'deal less with artifacts contrived for their formal value, and increasingly with men enmeshed *with* and *within* purposeful responsive systems'.¹¹

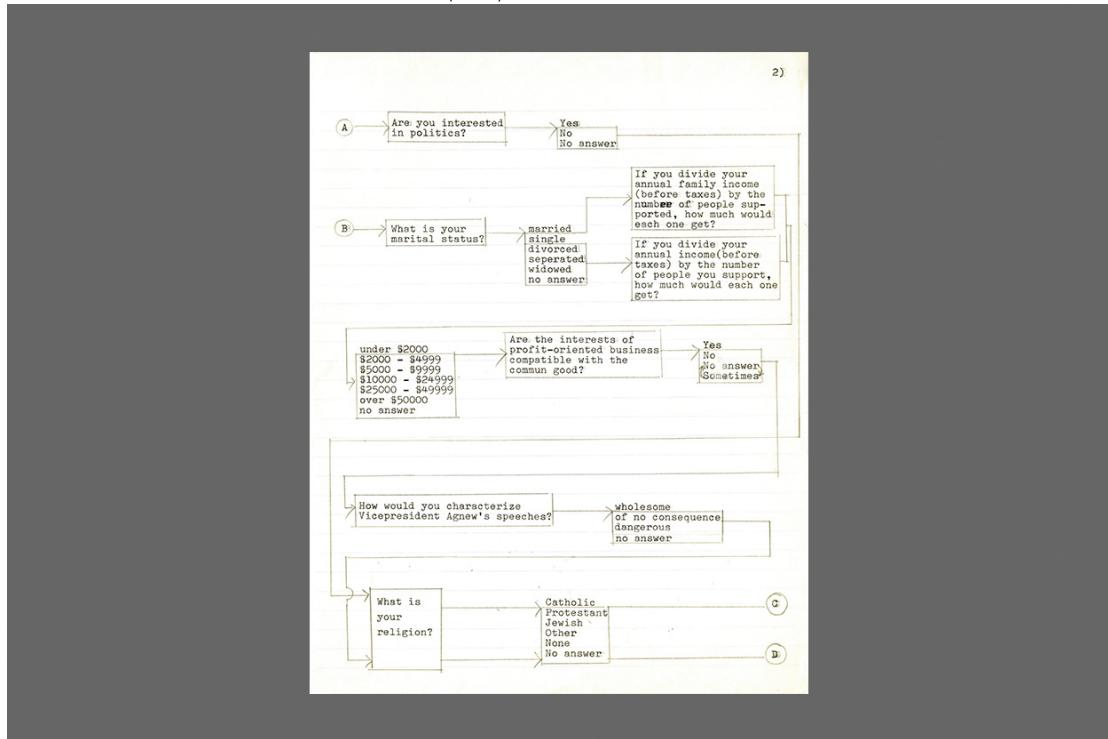

In the late 1960s, Haacke moved from investigating 'natural systems' (as in his pieces dealing with wind or condensation) to 'social systems'.¹² Haacke started presenting visitor polls as works of art in 1969 with his *Gallery-Goers' Birthplace and Residence* profile at the Howard Wise Gallery, the viewers becoming cybernetic performers by answering questions. Polls and profiles would go on to become ever more prominent in the economy, up to today's online profiles. Neither a technocratic affirmation nor an abstract rejection, Haacke's pieces attempt to play the system, to intervene in it through strategic mimicry.

In the 1970 'Information' show at New York's Museum of Modern Art, which was shaped by cybernetics, Haacke presented a poll with one political question, on New York Governor Nelson Rockefeller's stance on Vietnam. That Rockefeller was also a MoMA trustee was not stated, but for those in the know it served to underscore the interrelations between the art world and other social systems.¹³ For Burnham's 'Software' show at the Jewish Museum, also in 1970, Haacke planned a computer version of the visitor poll, allowing for a more complex series of questions that he developed in the form of flow chart diagrams. Due to technical difficulties, this version was not realized.¹⁴ Haacke's surviving flow

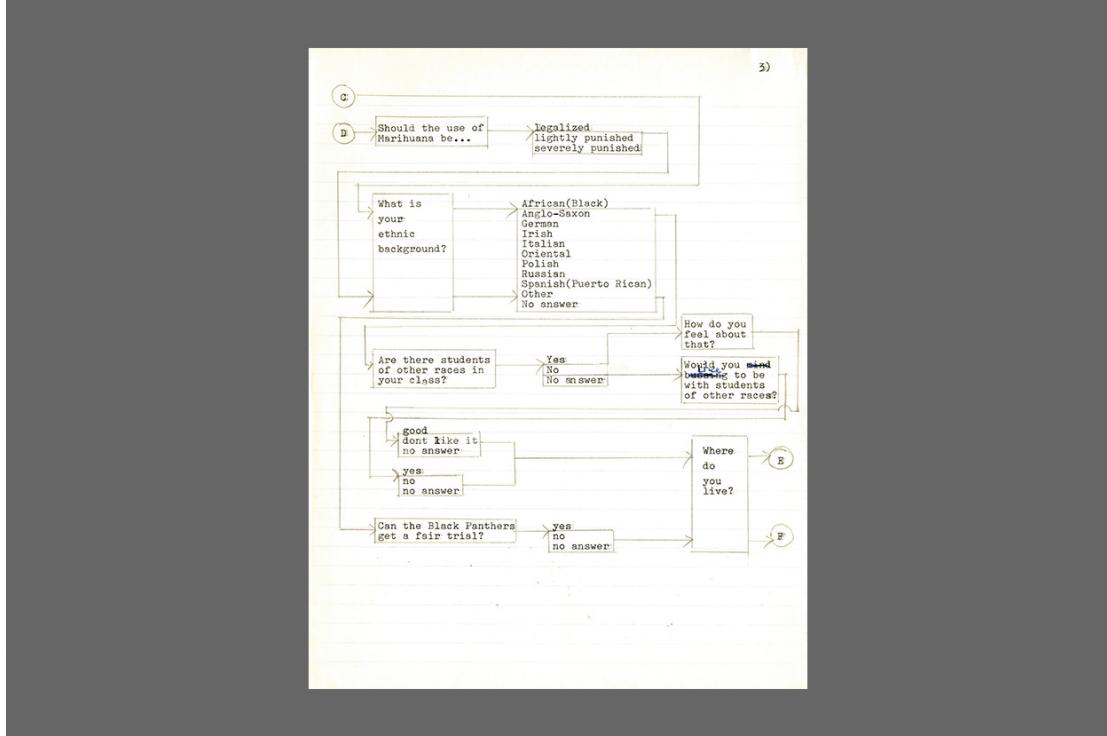

charts, with their mixture of personal and general political questions, are not so much about making 'the system' transparent as they are about our implication in it, and the effect of our specific situations on our perceptions and preconceptions.

Hans Haacke, flow chart (one of four sheets) for unrealized version of Visitors' Profile conceived for Jack Burnham's Software (1970).

Hans Haacke, flow chart (two of four sheets) for unrealized version of Visitors' Profile conceived for Jack Burnham's Software (1970).

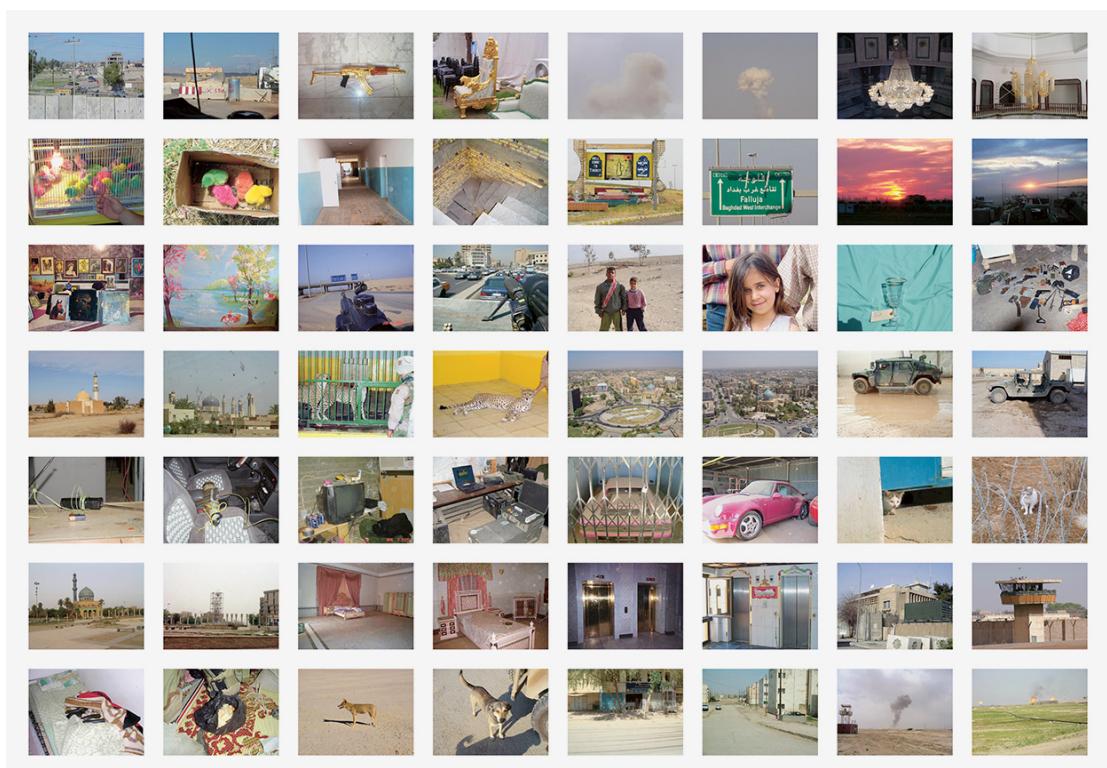

Hans Haacke, flow chart (two of four sheets) for unrealized version of *Visitors' Profile* conceived for Jack Burnham's Software (1970).

In systems theory, 'the system' risks becoming a theoretical fetish, a quasi-divine entity that governs fish and humans alike. But in Haacke's work the emphasis is not on system-theoretical analysis so much as it is on *intervention* in systems. His *Visitors' Profiles* and other pieces constitute interventions in social systems that *make visible their peculiar dialectic of opacity and transparency*. Opinion polls were regularly presented as typifying an 'open society' in which the citizen-consumer was 'king'; on the other hand, certain sociologists presented such instruments (with some justification) as just another tool in the arsenal of the 'hidden persuaders'. Rather than either condemning or praising the opinion poll, Haacke puts it to use, subverts it – asking questions about Nelson Rockefeller in a white cube. Haacke's work makes things visible, but at the same time it does not presume that making things visible is enough; gestures have to be timed and located very precisely – as with his *Manet-PROJEKT '74* in Cologne.¹⁵

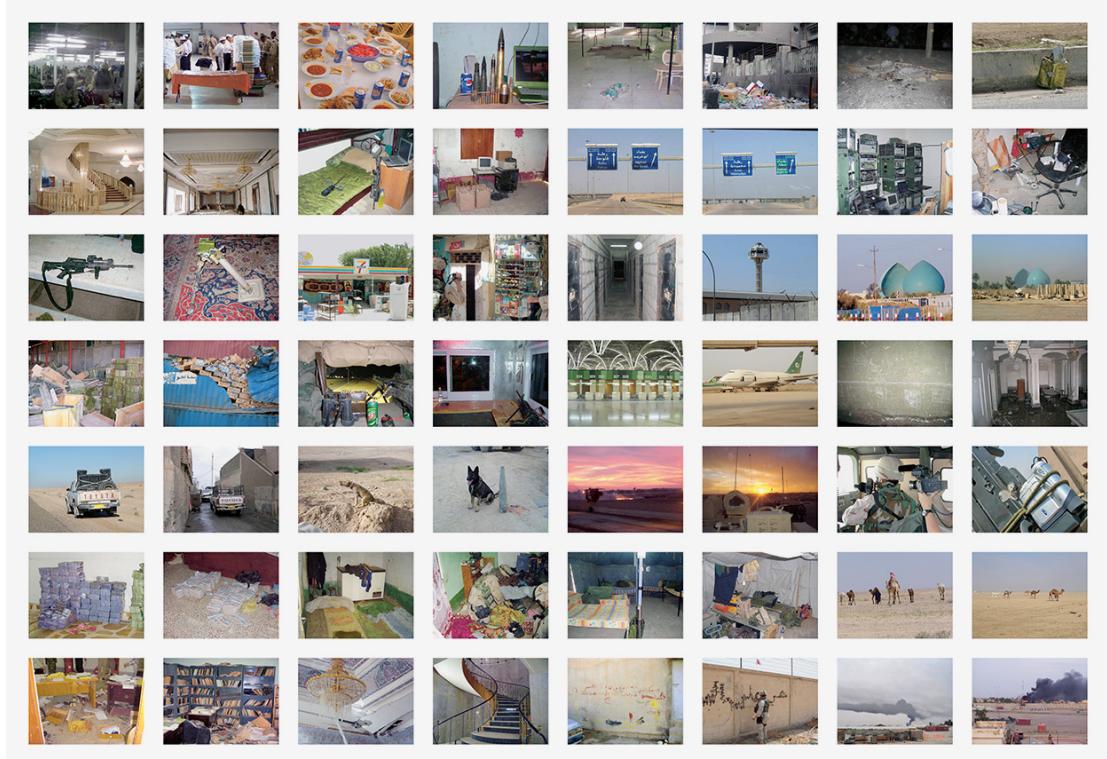

This is embedded, tactical critique that one could describe – in cybernetic terms – as mutated and unwanted feedback. If the gesture is too massive or too abstract, the effect is questionable. Whether 'revelations' of 'hidden secrets' as such are effective is highly doubtful. A few years before WikiLeaks went stratospheric, Walid Raad already addressed the limits of openness in a lecture / performance in which he traced covert CIA rendition flights and the people and (sham) companies enabling them. As dotted lines appeared gradually on the projection screen, Raad quoted the mocking questions a friend had asked him: 'Is there anything more fashionable anymore than to make public the contradictions at the heart of the US administration's war on terror? ... What if these policies are effective NOT because they have not been examined enough? What if these policies are effective NOT because no one has bothered to show that they are short-sighted and ill-conceived? What if those who kidnap and torture today depend on public exposure and visibility as part and parcel of what they do? In other words, what if these things can go on today because they are too clearly visible, broadcast live, entirely predictable – in fact, they have been announced outright in advance?'¹⁶

Object and Thing

The issue of the (im)mobility of persons in turn has its counterparts among objects. In works from 2003 to 2005 such as the film *Casio, Seiko, Sheraton, Toyota, Mars*, the photo archive *Untitled (Archive Iraq)* and the photo / text piece *The Site*, Sean Snyder has charted trajectories of a different nature than Raad's CIA flights, though these trajectories are equally part and parcel of the 'War on Terror' – which in Snyder's work becomes a series of appearances of Casio watches, Toyotas, Coke cans and Mars bars in the war theatre of the Middle East. Here the War on Terror is not about any great ideals but about access to and the deployment of commodities – products that in Snyder's work serve as symptomatic indicators of the real interests at stake. However, their visibility is in turn oddly opaque, and they seem to be playing games with us – like the whimsical Mars bars and Spam cans that appear to move around in various images and descriptions of Saddam Hussein's underground hideout. Is their presence just another convenient 'public exposure'?

Snyder shows snapshots from the social life of objects. In this, the work can be seen as a rejoinder to the commodity art of the late 1980s, when pieces by artists such as Haim Steinbach glorified commodity fetishism as the play of coded difference. 'Desire' and 'code' were the *mots du jour*, and the work's coded differences resulted in a curiously opaque transparency. The formal play is enjoyable, while the suggestion that it is all that matters is somewhat unsettling. The simple structures of the triangular shelves with their evenly spaced commodities no longer claim to be exercises in 'rational construction', nor do they critique such claims. They celebrate their shiny opacity, their literally superficial

qualities. What matters is surface; the object becomes a projection screen. In spite of or because of his works' complicity in a highly destructive economy, Steinbach thus articulated a very real characteristic of the Reagan era. Precisely in going implementing the passion for the code, so rigorously, the works retain an oddly resistant quality.¹⁷

But what about the invisible obverse of these commodities' alluring surfaces? The practice inaugurated by artist Kobe Matthys in 1992 under the generic name of Agency paralleled Snyder's in that it took a decisive step beyond commodity art – in the process reactivating aspects of the art of the late 1960s and early 1970s, such as Conceptual Art's focus on protocols and contracts. Agency collects 'Things' whose status has been contested in lawsuits over intellectual property rights; it 'convenes' these Things in the form of 'assemblies' (exhibitions or events) that allow for an investigation of these cases. Agency's Things range from a TV recording of a trained elephant to computer-generated bingo numbers, an 'Uncle Sam' bank, children's costumes and various books, records and films. In all these cases, the main question is whether we are dealing with 'original works' that can be copyrighted, raising questions on subjecthood and authorship. Can a trained elephant's behaviour be copyrighted by its trainer? Can a book said to have been dictated by spirits to a medium be subject to copyright? Can computer-generated bingo numbers?

Two of Agency's Things are based on the famous magic trick of *The Woman Sawn in Half*, which Horace Goldin sought to protect both in copyright law and in patent law in the early 1920s.¹⁸ When a film company released a short subject purporting to show how the trick was done, Goldin sued, and lost (*Thing 000809*). Much later, in the 1930s, he sued again when Camel Cigarettes published an ad in their series 'It's fun to be fooled . . . It's more fun to know', which also purported to reveal the truth (*Thing 000842*). He lost again, in part because of his own patent, which qualified as public information: at least in theory, the secret was already out. What is interesting about these Things in particular is that they almost seem to allegorize the commodity and its magical promise of shiny and eternal newness – which we know full well hides programmed obsolescence. The lady sawn in half and reconstituted is the hollow promise of any product: the reversal of entropy.

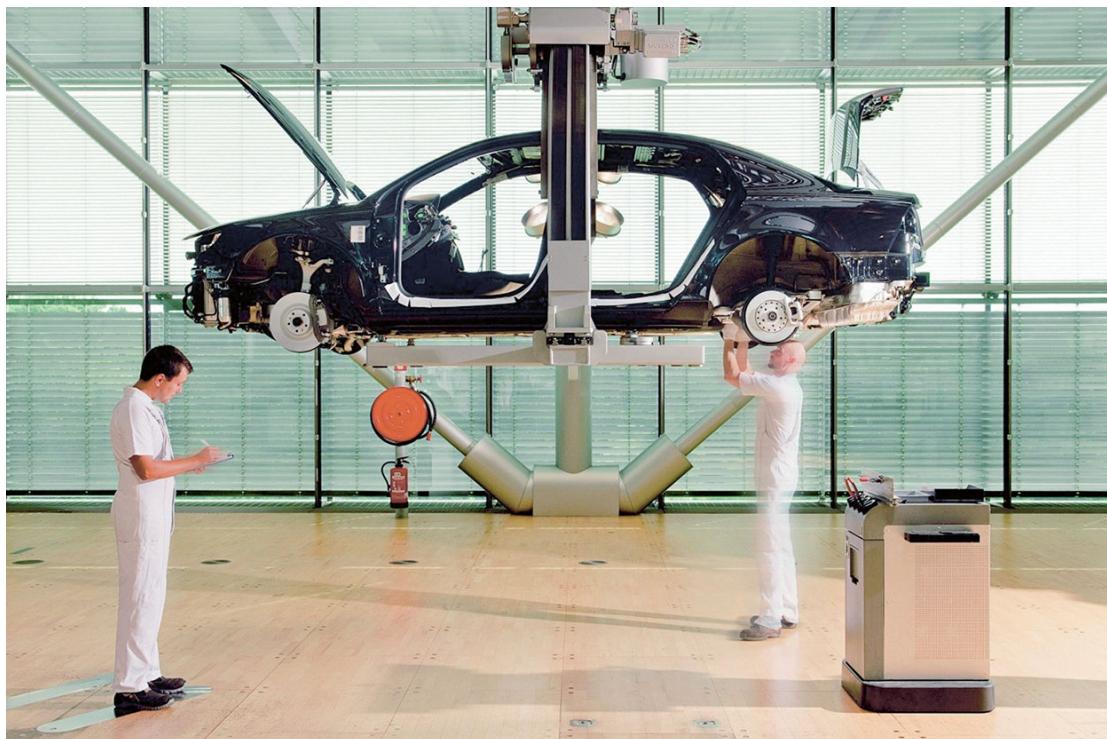

The notion of the *thing* is prominent in contemporary theory, and one might say that the thing has emerged as something that is *both more and less than an object*. In W.J.T. Mitchell's words: "Things" are no longer passively waiting for a concept, theory, or sovereign subject to arrange them in ordered ranks of objecthood. "The Thing" rears its head – a rough beast or sci-fi monster, a repressed returnee, an obdurate materiality, a stumbling block, and an object lesson.'¹⁹ Rather than building a wall between art and thingness, the work of art should be analysed as just such a sci-fi monster – a monster that itself has a secondary *agency*, as the anthropologist Alfred Gell has argued.²⁰ While objects are named and categorized, part of a system of objects, thingness is resistant to such ordered objecthood. If we grant that *works of art are both more and less than other types of things*, this should be regarded not as an incentive to exacerbate and fetishize those differences, but rather as a point of departure for examining the complex inter-relationships between various kinds of things, and the ways in which certain works of art problematize and transform this very relationship. The Marxian theory of commodity fetishism has long drawn attention to the 'theological whims' of commodities; these seeming social relationships between things are ultimately seen as distorted reflections of relationships between people. However, do the commodities in turn not play an active role in inflecting and shaping human relations?²¹

Hito Steyerl's recent film *In Free Fall* (2010) focuses on the 'lives' of Boeing airplanes that vegetate on a junkyard in the Mojave Desert, investigating their biographies from Howard Hughes and the Israeli air force to being recycled as DVDs. Depending on market fluctuations, planes may be used for movie productions or be sold to China for their scrap metal. *In Free Fall* does not fetishize the social relations between things. Both object and subject – or thing and person – act and are acted upon in a bewilderingly complex political economy. Steyerl's cameraman, for instance, lost a significant amount of work in

Hollywood because of the crash of the DVD market due to online streaming and file sharing. While it might seem that with *In Free Fall*, Steyerl 'has turned from the essayistic subject to the essayistic object', it may be more precise to say that the film focuses on objects as having a certain derivative and secondary *agency* that affects lives.²² It is by making such connections that Steyerl's film intervenes in an economic system that instrumentalizes transparency and opacity, openness and secrecy, with equal ease.

(In)Visibility and the Sub-Subject

Visibility does not equal transparency: complete transparency, after all, would pose no obstacle to light and hence produce no image. One might say that any image is the product of a particular admixture of opacity and transparency. Images have a tendency to be used as allegorical emblems, and this is particularly true of images of (relative) transparency. Think of Berlin's renovated Reichstag building, which now houses the Bundestag: while the use of mirrors and glass in the plenary chamber under the central dome can be somewhat dizzying, the bright space is usually presented as embodying an open and transparent democracy. Think of Volkswagen's 'Transparent Factory' in Dresden, in which we are shown how cars are assembled by robots, as if by magic, while we do not get to see the actual production of the individual parts and the financial and political wheeling and dealing.

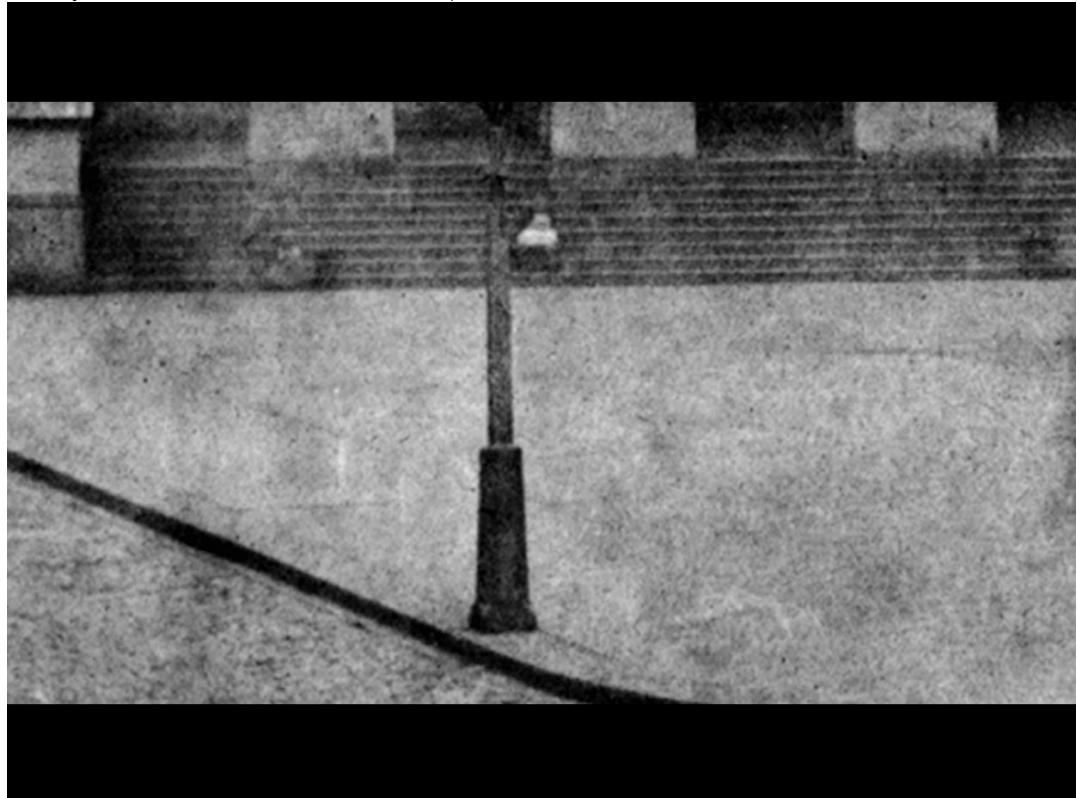

Volkswagen's so-called 'Transparent Factory' ('Gläserne Manufaktur') in Dresden.

As artist Zachary Formwalt notes in his book *Reading the Economist* (2010) on the basis of Marx's notations on *The Economist*: 'The invisibility of the instruments of exchange was the measure of their efficiency; the less visible, the more efficient they were in the circulation of capital.'²³ Formwalt's video film *In Place of Capital* (2009) muses on the (un)representability of capital in relation to the invention of photography, and in particular Fox Talbot's photographs of the London Stock Exchange, in which passers-by appear as immaterial spectres due to long camera exposures. *Reading the Economist* is a similar montage inquiry into capital and visibility. When a crisis hits, 'suddenly visible instruments of exchange are all that will do and the sudden demand for such instruments, for all other instruments to be converted into cash, or something very close to it, produces a rupture in

the field of visibility – the financial suddenly appears directly, not as something buried comfortably behind anonymous glass building facades or company logos in the Business and Finance sections of the press, but directly on the front pages as people demanding their money...' ²⁴

Zachary Formwalt, stills from *In the Place of Capital*, 2009. HD-video, 24'30".

Such scenes, such symptomatic 'assemblies', show abstract capital taking on visible form, congealing into thingness. This is not some abstract gesture of revelation, but a symptomatic manifestation of tensions within the system, which takes the form of specific constellations – improvised structures – emerging in the visual plane. If, in this case, this is the result of unplanned collective action (a kind of swarm-like activity), there are also possibilities for more strategic interventions that upset the dominant regime of (in)visibility, its particular collusion of opacity and transparency. Again, such interventions have to be precise and begin at home, so to speak. They have to show our implication in something that is more concrete than a / the system – in social structures or networks that implicate us. How do we intervene in such sub-systemic constellations in ways that make us visible as something other (either more or less) than the kind of subject to which we tend to be reduced?

In 2011, a number of artists announced a boycott of the Guggenheim Museum if the abysmal treatment of workers on the construction site of the Guggenheim Abu Dhabi – the latest outlet of the McGuggenheim franchise – continued. Walid Raad was one of the boycott's initiators, and Hans Haacke supported the campaign.²⁵ Guggenheims in New York, in Bilbao, in Abu Dhabi: a system of architectural objects serving the circulation of other (art) objects that thereby maintain or increase their value. Artists, critics and curators are supposed to play their part. But what if these labourers, these sub-subjects, were placed on the agenda as stubborn and opaque persons, rather than as purely abstract labour power? This political protest created a different kind of visibility by complicating the official image (of, in this case, the Guggenheim). Though this protest was not a work of art per se, in this sense it was most certainly a form of aesthetic praxis.

Sven Lütticken is a member of the editorial board of *Open! Platform for Art, Culture & the Public Domain*. He teaches art history at VU University Amsterdam; is the author of several books, including *History in Motion: Time in the Age of the Moving Image* (2013); and writes regularly for journals and magazines including *New Left Review*, *Afterall*, *Grey Room*, *Mute* and *e-flux journal*. At the moment he is working on a collection of essays under the working title 'Permanent Cultural Revolution,' and editing a reader on art and autonomy. See further: www.svenlutticken.org.

4. My earlier formulation of art as a 'mute form of political economy' does not imply that art is doomed only to reflect impotently, which is how Nikos Papastergiadis seems to take it in 'Aesthetics and Politics in the Age of Ambient Spectacles' (*Contemporary Art and Culture Broadsheet* 39, no. 1 (2010), 33–39). It is mute in so far as it falls short of all discursive conventions and of academic standards; this is also its potential strength. It is a form of praxis that can intervene in and rearticulate the regime of the (in)visible. At the same time, I remain doggedly convinced that one needs to go beyond grandiloquent claims for the potentiality of aesthetic practice, and confront the antinomies that both enable and – at times – cripple it.
